

AMDARI Internship: Stock Market Trend Analysis Project (Nov-25)

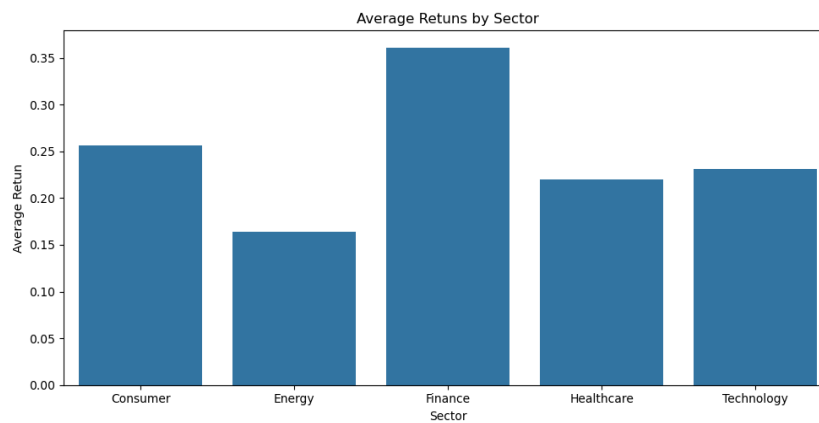

EDA Insights Summary

1. Price Trend Analysis

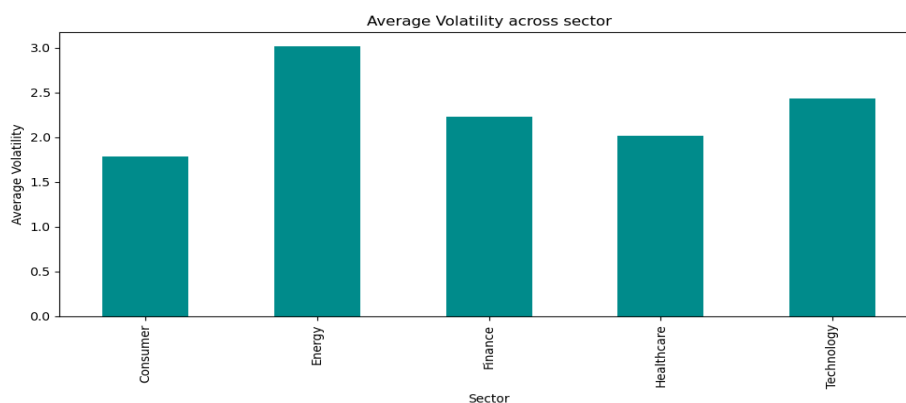

STK001 and STK009 show clear growth trend behavior but STK005, STK013, STK017 show flat trend and remain range bound.

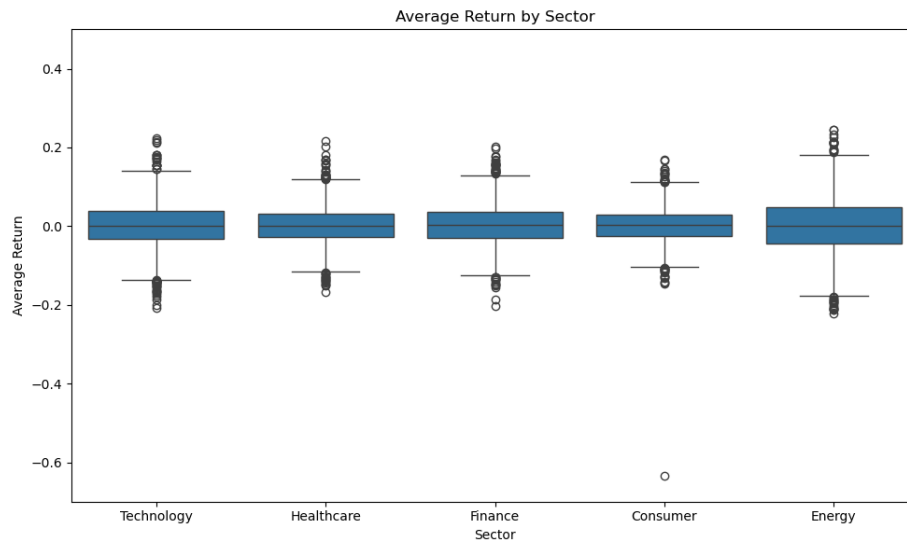

2. Sector Comparison

Finance and Consumer stocks lead and outperform all other sectors while Technology and Healthcare are mid-tier performers.

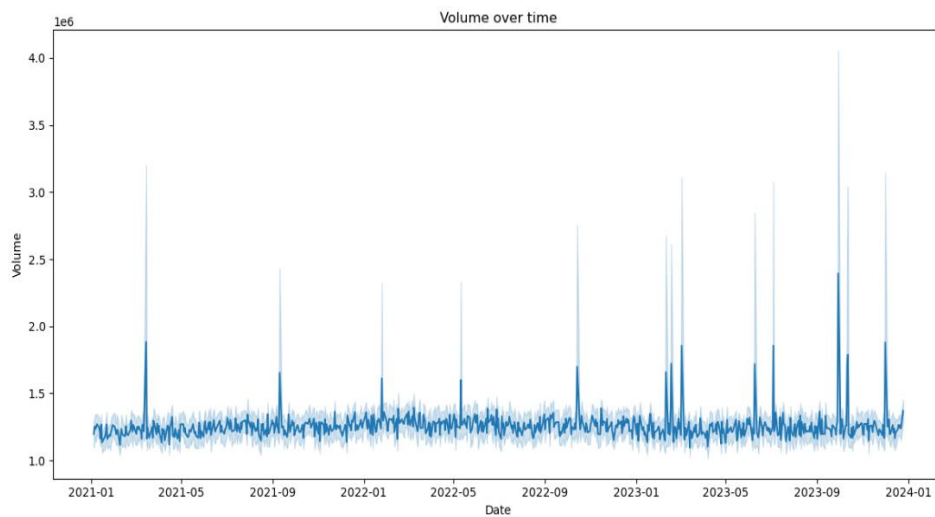

Energy assets exhibit the highest price fluctuations followed by Technology and Finance which show moderate volatility.

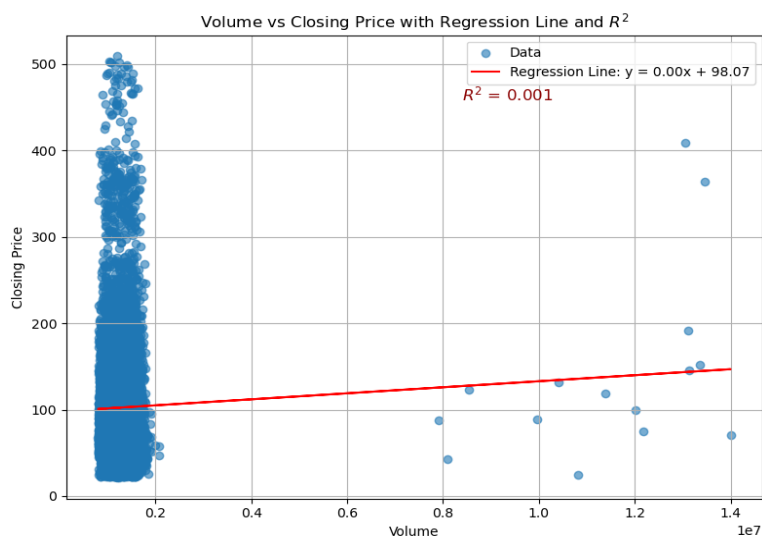

The Energy sector is erratic with inconsistent performance as opposed to a stable Consumer sector.

3. Volume Analysis

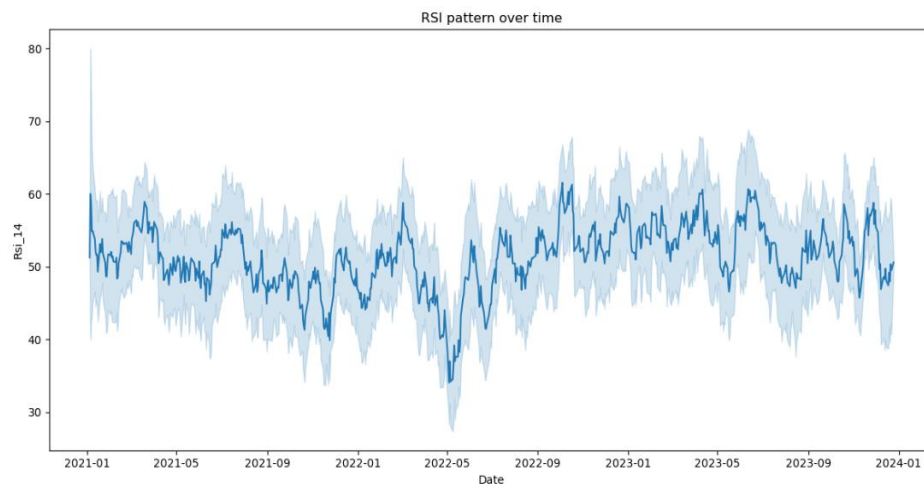

There are recurring volume spikes that suggest a cyclical market activity.

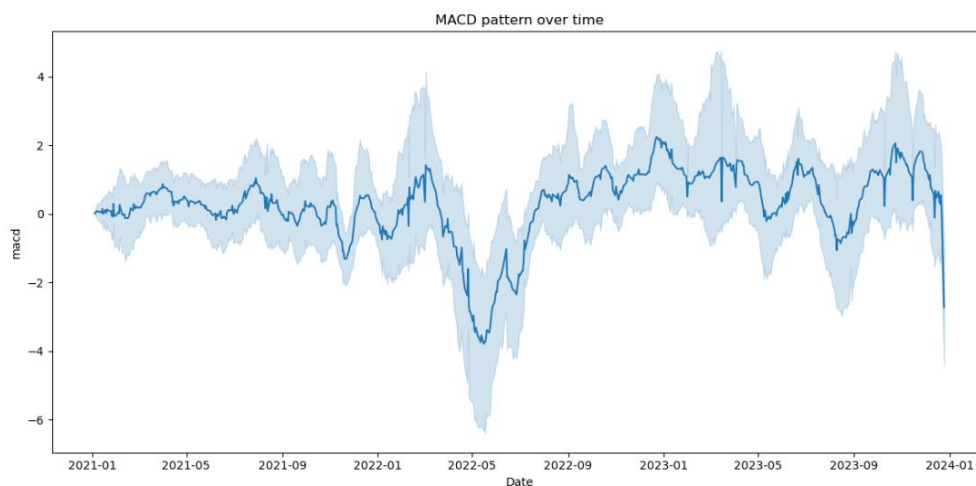

There is an extremely weak or no linear relationship between trading volume and closing price.

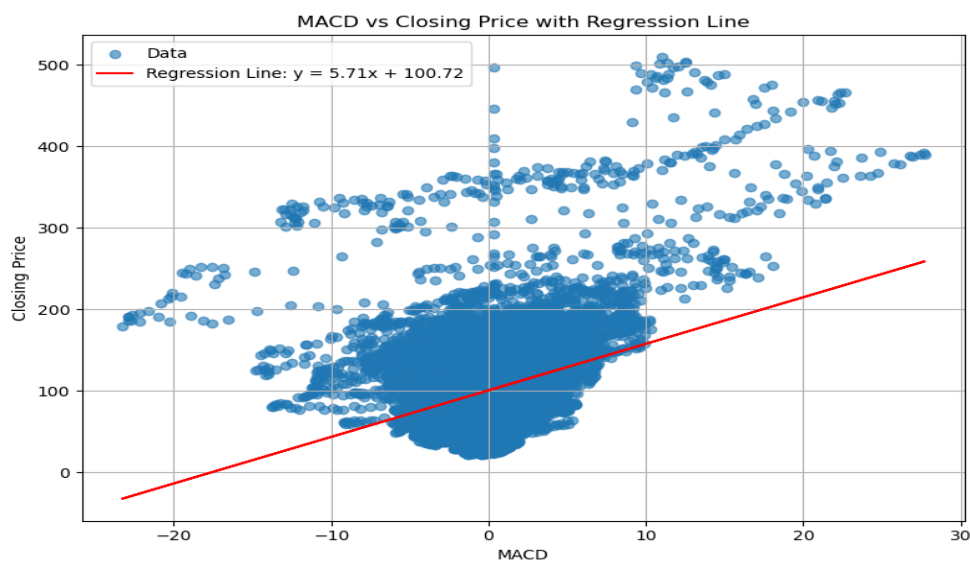

4. Technical Indicators Exploration

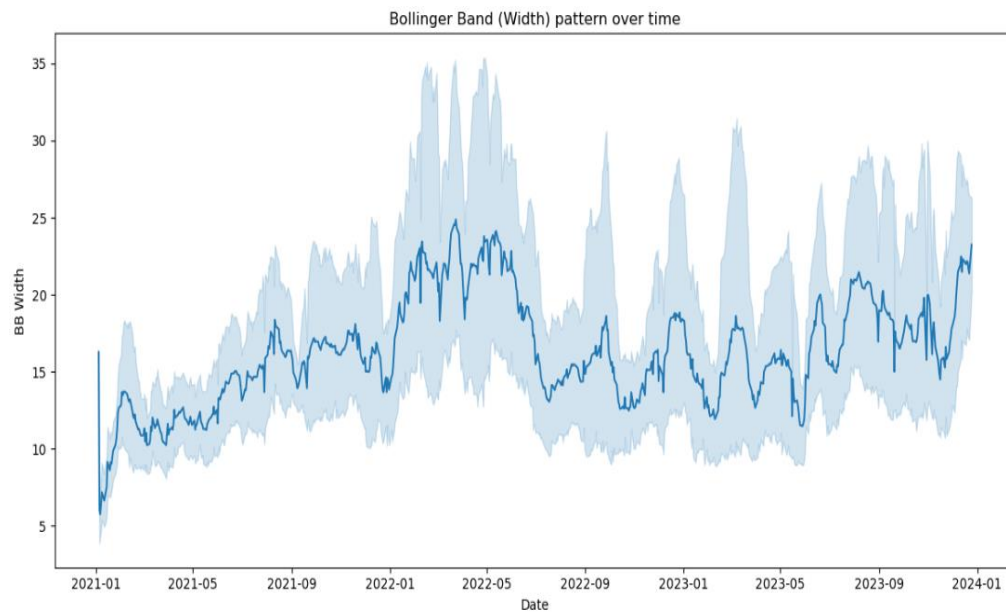

In general, the RSI fluctuated within expected bounds (between 30 and 80) and exhibited fewer overbought zones and oversold zones.

The market momentum recorded oscillations between positive and negative zones, indicating shifts between bullish and bearish momentum, notably dips around mid-2022 and sharp rises toward late 2023.

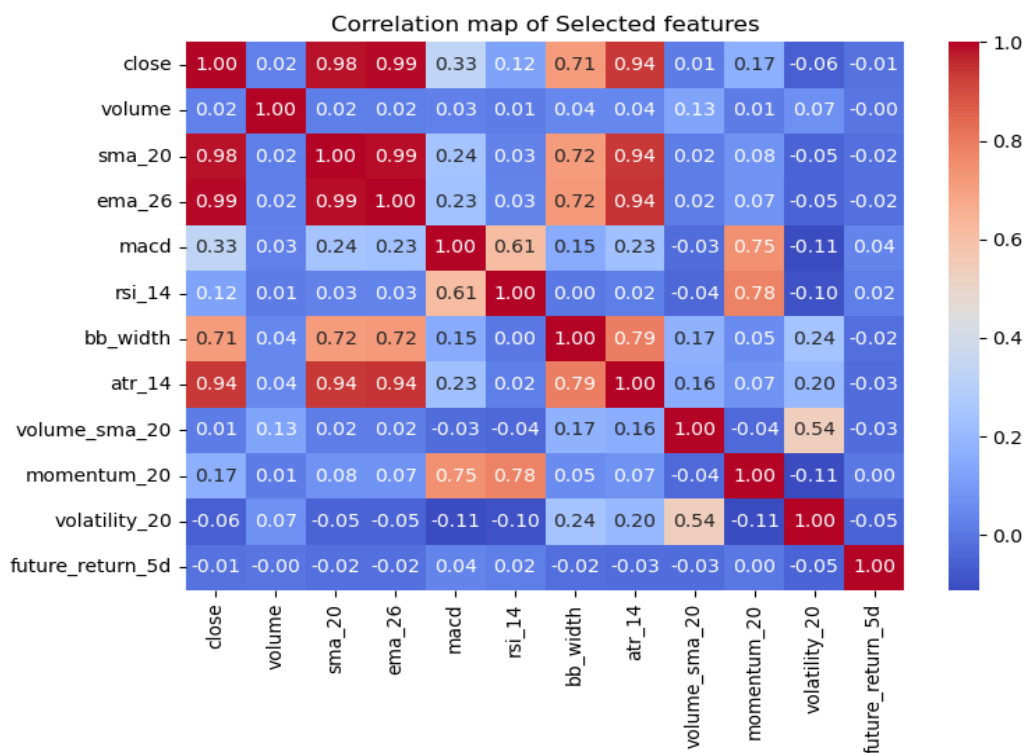

There is a moderate positive correlation between the MACD and closing price indicating that MACD can be used as a direct predictor of price levels.

The market volatility is here again confirmed with the observed fluctuations over time with notable peaks in early 2022 and mid-2023.

5. Correlation Analysis

The closing price is highly correlated with sma_20, ema_26 and atr_14. The macd correlates moderately with momentum_20 and rsi_14. Volatility indicators (bb_width, atr_14, and volatility_20) show low correlation with returns (indicating that volatility alone doesn't predict returns). Volume indicators (volume and volume_sma_20) show low correlation with returns.
